## AT A GLANCE

### Requirements

- Fully hygienic
- Effective flowrate
- Simple components
- No waste

### DryLink Benefits

- Quick transfer
- Reduced spillage
- Less maintenance downtime
- Hygienic solution

## CONTEXT

Innocent, the healthy drinks manufacturer and subsidiary of Coca-Cola, have completed the construction of a carbon-neutral drinks factory in Rotterdam, the Netherlands. The new factory, named 'the Blender', will produce more than 400 million bottles of juice a year.

## OBJECTIVES

The loading units for the trucks required transfer solutions. Specifically, they were looking for a hygienic dry disconnect coupling solution for the effective loading and unloading of road tankers.

The client's requirements were centered around a completely hygienic fluid transfer solution that was handleable, easy to use and with a high flowrate. The valuable product running through the line needed to be completely isolated.

## SOLUTIONS

After the initial enquiry our technical sales advisor discussed the application in full. To specify the correct solution we need to know full working conditions, from working pressures, seal compatibility and how and where the Couplings will be used.

Action Sealtite supplied 3" Internally polished Drylink Couplers and Adaptors with FDA approved EPDM seals and triclover end connections.

## BENEFITS

The huge saving on transfer time, spillage and reduction on maintenance downtime has meant the operations at Innocent Drink Inc is safer for employees and efficient.

Drylink meets the highest hygiene industry standards as the split butterfly valve design polished bore avoids dead spaces or crevices which trap bacteria.

This unique valve design vastly improves the flowrate, increasing efficiency - saving time and money.
